

DriverPass System Analysis

Kimberly Gilbraith

SAY:

Hello Everyone. Thank you for meeting with me today. My name is Kimberly Gilbraith. I am here today to walk you through the system design we have developed for DriverPass. My goal is to develop a product that meets the needs you requested during our first meeting. Today I will present a high level overview of our designs. This solution offers a 24/7 platform with integrated, up-to-date practice exams and information, as well as the ability to select driving practice packages. This solution will provide your staff with the tools needed to run a smooth operation while resolving the issue you uncovered in your own research: that over 65% of students fail their driving tests because they only study outdated exams without structured preparation.

System Requirements

- **Functional Requirements (What the System Does):**

- Interactive Student & Practice Hub
- Automated Driving Lesson Scheduling
- Mobile Instructor Logging

- **Non-Functional Requirements (How the System Operates):**

- User Based Profile Access
- Scheduling Reliability

SAY:

In this system, we grouped the needs of DriverPass into two main areas: what the system does, or Functional Requirements, and how it performs behind the scenes—or its nonfunctional requirements.

DO:

Select to show the next text.

SAY:

Functionally, the system gives your students 24/7 web access to interactive practice exams and provides them automated driving lesson scheduling directly from their account.

DO:

Select to show the next text.

SAY:

Included in the functionality for your staff is the ability for your secretary to also access the automated driving scheduling, your drivers will have remote log in access to update student notes immediately following a lesson.

DO:

Select to show the next text.

SAY:

Non-functional requirements include secure user-based profile access that restricts access to the system based on their role such as student, secretary, IT, driver, etc...) and built in scheduling checks to ensure accurate and reliable fleet scheduling for your 10 cars and 10 drivers..

Use Case Diagram

SAY:

This diagram shows the different users we identified for your system. We have mapped out the tasks each user will need to be able to perform for DriverPass to be successful. In this diagram we see a high level view without all the programming involved. This diagram shows we will develop the application for 6 different types of users, the Business Owner, your drivers, your IT admin, your secretary and your students and the Department of Motor vehicles. Each user type will have customized access to your system based on their needs. As we look at the different users and their required actions, we have the business owner.

DO:

Use a pointing tool (or other visual cue for those in the room) to highlight the area of the diagram you are referring to as you speak to each user role.

SAY:

The business owner will have access to manage training packages, view and/or create reports and system logs, as well as export these reports and logs to an Excel file for offline review.

Your drivers will have access to view driving schedules, update post lesson notes on their student, and view pick-up/drop off location details from the student profiles. Your IT admin will have access to manage all user accounts, reset passwords, and monitor or perform security audits as needed.

Your secretary will have access to Manage any customer account, manage instructor and car schedules, and manage any driving lesson, while students will need access only to manage their own accounts, select their own training program or driving lesson, as well as access to practice and training materials, and to view their personalized dashboard.

Finally, we will have a user profile for the DMV that allows the update of driving rules and regulations, and the update of practice tests and other materials.

Ultimately, every role in this diagram directly addresses your core business needs by giving students the 24/7 practice tools they need to pass their exams, while streamlining daily scheduling for your 10-car fleet and driving instructors. Custom user profiles, eliminate double-booking errors and tedious phone tag across your daily operations. The separate user profiles for your business owner and IT admin, ensures the security and administrative oversight and reporting capabilities you need to run DriverPass efficiently and grow with confidence.

Activity Diagram

Presenter note only:

Selecting the diagram on screen will take you to a full screen version of this diagram. Consider your audience and screen sizes and decide if this would be better displayed full screen. (The same talking points will be visible on the full screen version if you choose to present that slide instead of this one.)

If moving to the full screen visual of this diagram:

SAY:

Let's take a look at one of the daily tasks, and how it will flow from start to finish. This activity diagram models the exact step-by-step process your secretary will have access to while managing and scheduling a driving lesson to ensure no cars or instructors are double-booked. Let's expand the view so we can walk through each step together.

DO: Select the diagram on screen to show a larger view of the activity diagram.

If continuing to present from this slide:

SAY:

Let's take a look at one of the daily tasks, and how it will flow from start to finish. This activity diagram models the exact step-by-step process your secretary will have access to while managing and scheduling a driving lesson to ensure no cars or instructors are double-booked.

DO:

Gesture or point to the appropriate section of the diagram as you explain the steps in this process.

SAY:

This process starts with the secretary logging into your system, then navigates to "Lesson Management". As the secretary will be able to update any lesson, they will then search for the student profile and once found, select an action. Notice that as the secretary attempts to update or schedule an appointment the DriverPass system runs a secondary check to confirm or update the schedule. This ensures there are no scheduling conflicts before the change is finalized. Once the secretary confirms the change, the student and instructor receive a confirmation or notification of the change. These notifications will be delivered in the form of an automated email or text message. Automating this workflow eliminates manual paperwork, ends double-booking errors, and saves your office staff hours of phone calls each week.

SAY:

Protecting DriverPass’s business information and ensuring student privacy is a high priority for our team. Its critical to our system designs. Rather than relying on simple passwords alone, we have integrated multiple safeguards across every level of the application. Let’s look at how each key protection keeps your platform secure.

DO:

Select to show the next text.

SAY:

The first security measure we designed is in our customized user profiles. These profiles act like digital keycards, ensuring each user profile is limited to only the areas of the system they need. This prevents unauthorized access across accounts and keeps personal information isolated to a need to know basis.

DO:

Select to show the next text.

SAY:

Second, all sensitive data is fully encrypted. Everything from student permit numbers, personal contact details, and login credentials remains secure; regardless whether it is stored in our databases or traveling across the web.

DO:

Select to show the next text.

SAY:

Next, the system automatically maintains continuous, unalterable activity logs. These logs can be utilized to show who logged in and at what time, what changes they made, or even failed log in attempts. This allows your IT administrator to monitor logins, password resets, and user management events for complete transparency.

DO:

Select to show the next text.

SAY:

Finally, automated daily cloud backups ensure that your business records, student information, scheduling data and logs are always protected and easily recoverable in the event of an outage or technical failure.

DO:

Select to show the next text.

SAY:

By combining digital keycard access, data encryption, audit logging, and automated daily backups, we ensure DriverPass and its students remain protected from day one. These protections give your business the secure foundation it needs to operate with total peace of mind. As we finalize our system overview, it is equally important to understand the practical scope and current operating boundaries of this initial release.

System Limitations

- Fleet/Driver Capacity
- Data Connections
- Third Party Payment System
- DMV Updates
- No Active GPS Tracking

SAY:

To ensure a successful, on-schedule delivery, our design established boundaries for the features and uses this initial delivery will have. Identifying these boundaries upfront allows our engineering team to build a stable design tailored specifically to DriverPass's immediate business needs while also identifying additional features that could be included in future releases. Let's walk through some of these limitations for our initial release.

DO:

Select to show the next text.

SAY:

First, regarding fleet and driver capacity: The scheduling matrix is limited to DriverPass's current business operations of 10 vehicles and 10 instructors across 2-hour lesson blocks. This built-in boundary prevents scheduling errors and guarantees you will never overbook your available resources.

DO:

Select to show the next text.

SAY:

Secondly, data connections are required. Real-time schedule adjustments and on-the-road driver notes depend on active data connections through cellular data or Wi-Fi. If an instructor is temporarily in a low-coverage zone or runs out of charge on their device, updates synchronization happens as soon as the connection is restored but may interfere with the need for real-time updates or changes.

DO:

Select to show the next text.

SAY:

Third, your business will be reliant on a third-party payment systems. For online transactions, we route payments through an established, secure third-party gateway to keep credit card processing PCI-compliant. For customers who prefer paying in person at your office, your secretary will use a terminal payment system to process and record the transaction. Should the third-party system go down, this will affect your operations as well.

DO:

Select to show the next text.

SAY:

A fourth limitation is on the DMV Updates. While our platform is designed to receive updated rules and test materials directly from the Department of Motor Vehicles, the frequency of those updates depends on the DMV's external publication schedule. Delays in their process will affect the accuracy of your resources as well.

DO:

Select to show the next text.

SAY:

Finally, active GPS tracking will not be implemented in this initial Phase 1 release. To keep development streamlined, we have not mapped out this feature for our initial build. Lesson progress and student verification are managed through instructor dashboard check-ins and post-lesson notes.

DO:

Select to show the next text.

SAY:

In summary, these initial boundaries ensure that the platform focuses squarely on DriverPass's core priority: delivering dependable scheduling, reducing paperwork, and providing structured practice tools so your students pass their driving exams.

Thank you very much for your time and collaboration today. We believe this system design gives DriverPass the modern, secure, and scalable foundation you need to streamline operations and expand your business. I would now love to open the floor to answer any questions you or your team might have.
